#### Abstract

The palatal depth differs from patient to patient, but the available stock trays are of uniform depth. This may lead to inappropriate impression and loss of excessive impression material. This study aims to measure palatal depth of different individual casts and comparison of palatal depth with available stock trays.

KEYWORDS: Palate depth, stock trays, individuals.

## INTRODUCTION

Good quality dental impression is the most important step in fabricating well fitting dentures and prosthesis. The impression trays play a vital role for cast manufacturing. ${ }^{[1]}$ Stock tray comes in different uses made of plastics and metal. The impression tray should have sufficient extension to support the impression material. ${ }^{[2]}$ However, there is not much improvement in design of available stock trays and they need modification before use. ${ }^{[1,3]}$ Clinical experience are shown that the stock trays are not suitable for providing variation in palatal depth of different dental arches. ${ }^{[4]}$ The palatal depth of stock tray is not sufficient and it varies from patient to patient. The palatal depth might be of different shapes and sizes. ${ }^{[5,6]}$ The commercially available stock trays are with uniform palatal depth and it seems to be inadequate for a proper impression. ${ }^{[7]}$ This study was based on comparison of palatal depth in individuals and stock trays.

## AIM

The purpose of study was to evaluate the depth of palate in stock trays and comparison between the palatal depths of the individuals and to recommend a suitable design of stock tray for proper impression.
depth. The palatal depth of the maxillary arches has been measured by digital caliper. The depth of palate is measured at the intersection of midline and highest cusp of first molar. The measurement of 50 dentulous patient casts is assigned as Group A. The data obtained was co-related with measurements obtained from the palatal depth of commercially available stock trays.

## Measurements of available trays

The three available types of perforated maxillary stock trays of different brands were measured. The maximum depth at the molar regions is measured by digital caliper in each tray. The commercially available API, GDC RIMLOCK, SAMIT stock trays is measured and assigned as Group B, Group C, Group D respectively.

## STATISTICS AND RESULTS

The statistics (mean, standard deviation, standard error mean) of 50 variables for palatal depth measurements are presented in TABLE 1, which shows the average mean of $22-23 \mathrm{~mm}$.

Table 1.

| $\mathbf{N}$ | Mean | Std. Deviation | Std. Error Mean |
| :---: | :---: | :---: | :---: |
| 50 | 22.3448 | 1.94995 | 0.27577 |

## MATERIALS AND METHODS

## Measurement of casts

A total of $\mathbf{5 0}$ dentulous patient cast from $\mathbf{3}$ size tray were evaluated extra orally to obtain maxillary palatal

One-Sample Statistics

|  |  | Statistic | Bootstrap ${ }^{\text {a }}$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Bias | Std. Error | 95\% Confidence Interval |  |
|  |  | Lower |  | Upper |
| Group A | N |  | 50 |  |  |  |  |
|  | Mean | 22.3448 | . 0131 | . 2758 | 21.8092 | 22.8909 |
|  | Std. Deviation | 1.94995 | -. 03781 | . 18023 | 1.54605 | 2.25046 |
|  | Std. Error Mean | . 27577 |  |  |  |  |
| a. Unless otherwise noted, bootstrap results are based on 1000 bootstrap samples | Unless otherwise noted, bootstrap results are based on 1000 bootstrap samples |  |  |  |  |  |

The palatal depth of GROUP B stock tray is 12 mm . The comparison between GROUP A and GROUP B is presented in TABLE 2.

Table 2: One-Sample Test.

|  | Test Value = 12 |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{t}$ | $\mathbf{d f}$ | Sig. (2-tailed) | Mean Difference | $\mathbf{9 5 \%}$ Confidence Interval of the Difference |  |
|  |  |  |  |  |  |  |
|  | 37.513 | 49 | .000 | 10.34480 | 9.7906 | 10.8990 |

The palatal depth of GROUP C stock tray is 13 mm . The comparison between GROUP A and GROUP C is presented in TABLE 3.

Table 3: One-Sample Test.

|  | Test Value = 13 |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | t | df | Sig. (2-tailed) | Mean Difference | 95\% Confidence Interval of the Difference |  |
|  |  |  | Lower |  |  |  |
|  | 33.887 | 49 | .000 | 9.34480 | 8.7906 | 9.8990 |

The palatal depth of GROUP D stock trays is 12.5 mm . The comparison between GROUP A and GROUP D is presented in TABLE 4.

Table 4: One-Sample Test.

|  | Test Value = 12.5 |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{t}$ | $\mathbf{d f}$ | Sig. (2-tailed) | Mean Difference | 95\% Confidence Interval of the Difference |  |
|  |  |  | Lower |  |  |  |
|  | 35.700 | 49 | .000 | 9.84480 | 9.2906 | 10.3990 |

Table2, Table 3, Table 4 demonstrates high significant differences of almost $9-10 \mathrm{~mm}$. Thus the available trays are not adequate for proper impression.

## CONCLUSION

Within the limitations of study from the result applying, it was concluded that existing palatal depth of dentulous stock trays are not sufficient, according to dentulous arches and increase in palatal depth is required to be done on trays for making more accurate impressions.
